

Process Pipe Work Repainting Services

Advanced Engineering Solutions Limited (AESL) offers specialist process pipe painting and repainting to the customer's required specification or can offer advice on the types of coatings that should be used for particular applications and environments.

The service includes surface preparation via power brushing or grit blasting (wet or dry).

All work is carried out in accordance with the paint manufacturers instructions. The works are supervised by a fully trained paint inspector, with office back-up from an ex-paint chemist.

All work is undertaken only when the conditions, temperature and humidity, are acceptable.

AESL operates a partnership with a scaffolding company that provides scaffolding and weather protection methods. All scaffold is subject to regular inspection, certification and tagged as required by HSE.

AESL issues to the client a fully documented Method Statement, taking into account the customers operational requirements. In addition a fully documented Risk Assessment is prepared for each job which is 'signed off' by a Chartered Engineer.
